EXPERIMENTAL GRAPHICAL ABSTRACT

From mechanisms to bounded claims

Source reconstruction, corrected comparisons and new extensions remain separate. Recall cohort: 5120 independent agent-world units in 5 declared strata.

A: 3 x 2

Recall and independent prediction

Matched exposure and replay dose separate positive selection from learning and independent prediction.

Optimism shifts and predictive accuracy differ; effects depend on the world and comparator.

A: 2 x 2

Recorded absence and counterfactual value

A no-event token can update belief; the missing-record rule supplies no likelihood.

Valuing an avoided harm changes assigned value without creating favorable evidence.

A: 3 x 13

Native attention and learned-channel transfer

Native GNN/pymdp runs distinguish agent and process; transfer bridges remain separate.

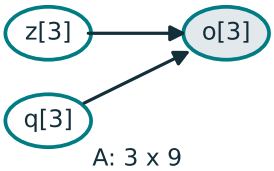
The source supplies before-only gaze. A favorable attention shift need not improve prediction.

A: 2 x 3

Enacted inquiry and effective access

Paid activity, effective access and evidence-based retention or revision are distinct operations.

Blocked access can incur cost without revision; exact enumeration retains adverse selections.

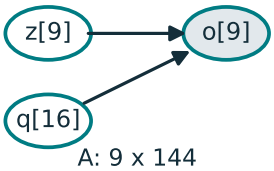


A: 3 x 9

Adaptive scene sampling

Complete query-conditioned GNN channels expose a context-dependent access advantage.

Already-open and uniform controls do not establish a further inquiry-specific benefit.



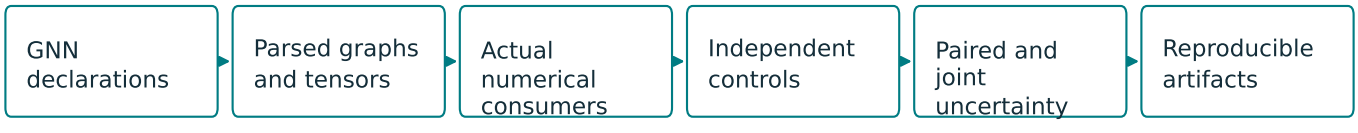
A: 9 x 144

Joint scene and encoding inquiry

Spatial and contingency queries test joint inference over the scene and its encoding.

Equivalent laws remain unidentified; excluded support stays unavailable; the reference anchor is stipulated.

Execution and evidence remain inspectable



Glyphs unpack the admitted likelihood: s or z is hidden, o observed and q a known query. Dimensions come from executed GNN. The world glyph is one declared stratum; complete models and controls follow.

Synthetic model evidence does not establish human gratitude, clinical benefit, contemplative realization or philosophical equivalence.
